Overview

The MicroBlaze Debug Module (MDM):

- Enables JTAG-based debugging of one or more MicroBlaze processors. It also provides JTAG-based communication to the Xilinx MicroBlaze Trace Core.
- Includes a master FSL interface.
- Instantiates one BSCAN primitive. In the Virtex®-4 and Virtex-5 architectures which contain more than one BSCAN primitive, MDM uses the USER2 BSCAN by default.
- Includes a UART with a configurable slave bus interface which can be configured for either a PLBv46 bus or an OPB bus.

The UART TX and RX signals are transmitted over the FPGA JTAG port to and from the Xilinx Microprocessor Debug (XMD) tool. When the data width is 8, the UART behaves in a manner similar to the OPB_UARTLITE or the OPB_JTAGUART cores.

The block diagram of the module is shown in the following figure:.

1. The range specified by C_BASESADDR and C_HIGHADDR must be sized and aligned to some power of 2, 2n. Then, the least n significant bits of C_BASEADDR are zero. This range needs to encompass the addresses needed by the MDM UART registers.

Allowable Parameter Combinations

There are no restrictions on parameter combinations for this core.

Parameter-Port Dependencies

The core has no parameter-port dependencies.

MDM Registers

The MDM registers are listed and described in Table 3.

Table 3: MDM Registers

Register Name	Size (bits)	Address Offset	Initial State	Description
Rx_FIFO	C_UART_WIDTH	0	0	JTAG UART receive data
Tx_FIFO	C_UART_WIDTH	4	0	JTAG UART transmit data
Status_reg	8	8	0x04	Read only bit 7 rx_Data_Present bit 6 rx_Buffer_Full bit 5 tx_Buffer_Empty bit 4 tx_Buffer_Full bit 3 enable_interrupts
Ctrl_reg	8	C	0x03	Write only bit 3 enable_interrupts bit 5 Clear Ext BRK signal bit 6 Reset_RX_FIFO bit 7 Reset_TX_FIFO

MDM Interrupts

If the interrupt enable register bit in the control register is set, the UART raises the interrupt signal in the cycle when the TX FIFO goes empty, or in every cycle where the RX FIFO has data available.

Design Implementation

Target Technology

The intended target technology is an FPGA in one of the following families: Spartan-3, Spartan-3E, Spartan-3A, Spartan-3A DSP, Automotive Spartan-3/3A/3E/3A DSP, Spartan-6, Virtex-4, Virtex-4QV, Virtex-4Q, Virtex-5, Virtex-5FX, Virtex-6.

Device Utilization and Performance Benchmarks

Not available.

Specification Exceptions

When programming a SystemAce device, the MDM clock must be at least twice as fast as the SystemAce controller clock for the ELF file to load correctly.

Reference Documents

The MDM core is intended to be used with the EDK XMD tool. For more information on how to debug using MDM and XMD, see the *Embedded System Tools Reference Manual*.
